

Download Common Induction Standards 2011

Answers

This used to be a blog about the arguments for and against theism and atheism. You may have noticed I don't talk about those subjects anymore. Cristian wrote, Some are certain that all answers should be given within the boundaries of scientific knowledge. And they call those that are certain of things outside science delusional or arrogant. An induction motor or asynchronous motor is an AC electric motor in which the electric current in the rotor needed to produce torque is obtained by electromagnetic induction from the magnetic field of the stator winding. An induction motor can therefore be made without electrical connections to the rotor. An electric motor is an electrical machine that converts electrical energy into mechanical energy. Most electric motors operate through the interaction between the motor's magnetic field and winding currents to generate force in the form of rotation.
