In statistics, linear regression is a linear approach to modelling the relationship between a scalar response (or dependent variable) and one or more explanatory variables (or independent variables). Box and Cox (1964) developed the transformation. Estimation of any Box-Cox parameters is by maximum likelihood. Box and Cox (1964) offered an example in which the data had the form of survival times but the underlying biological structure was of hazard rates, and the transformation identified this. This webpage provides recommendations for econometrics books. Options for undergraduate econometrics, graduate econometrics, and other fields are provided. The other fields include panel data, count data, duration data, nonparametrics, bayesian econometrics, and the bootstrap.
